

Inductive Sensors with IO-Link Interface

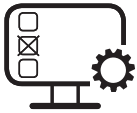

IO-Link

Benefits and features

IO-Link is the first international and manufacturer-independent standardised (IEC61131-9) communication interface that enables consistent communication from the sensor to the PLC.

A point-to-point connection enables not only the transmission of the switching signal, but also parameter, diagnostic, and communication data.

Flexible programming and monitoring

- Sensor output configurable as NO or NC
- Flexible teach-in of the switch-on and switch-off point up to the maximum switching distance of the sensor
- Monitoring of the operating hours and counting of the switching operations since starting the system

Simple commissioning and fast maintenance

- Simple integration into existing connection structures
- No high wiring costs due to use of M8 and M12 standard plug connections and unshielded 3-wire standard cables

Spare parts stock

- Reduction of spare stock due to fast configuration of standard sensors
- Flexible use via SIO and IO-Link mode

Manufacturer and fieldbus independent

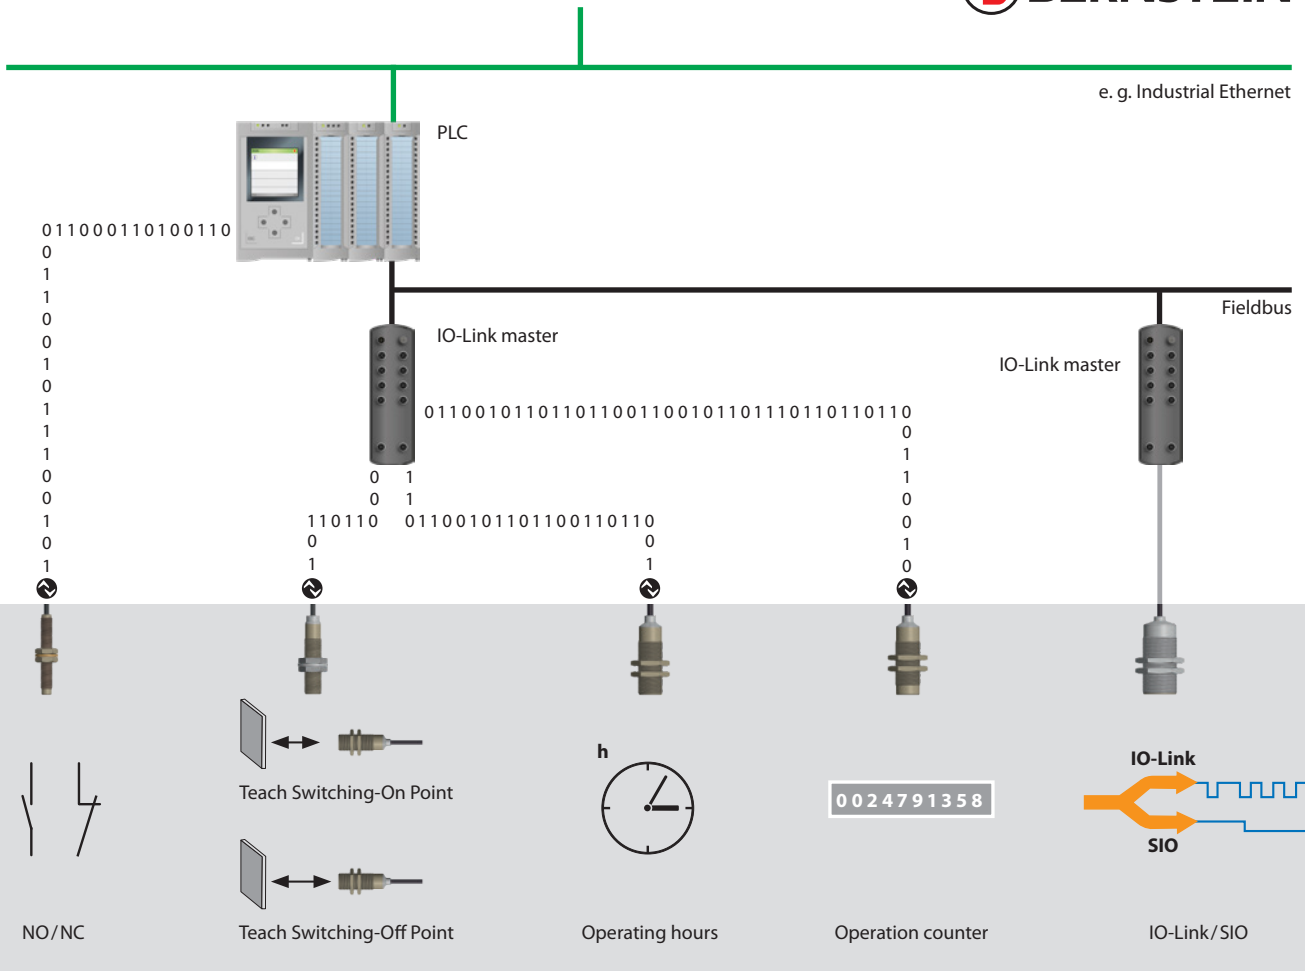

- Fieldbus-independent via appropriate IO-Link master
- The standardisation enables manufacturer-independent integration

Self-diagnosis

- Wire breakage or short-circuit are immediately detected by the master
- Critical internal voltages are detected in IO-Link mode
